

Rotary Solutions launches a 2-post lift with AV arms

Bräunlingen. October 2025 – Vehicle Service Group (VSG), a leader in the automotive equipment sector, launches the SPOA40AV, a new model of electro-hydraulic 2-post lift with innovative AV (“all vehicles”) arms, ideal for lifting any vehicle.

A lift for all needs – a statement that sums up the essence of the new electro-hydraulic 2-post lift designed by Rotary Solutions. The latest addition to the SPOA series, it consolidates the brand's long-standing electro-hydraulic features in a single unit that ensures energy savings during operation with fast lowering and lifting times.

The double S-profile and increased contact surface of the lift columns with trolleys ensure maximum stability with minimum space requirements. The upper limit switch also protects vehicles with a higher overall height from damage during lifting.

What makes it unique is the geometry of the AV arms, which guarantee maximum flexibility for workshops, allowing it to be used on a wide range of vehicles, from classic city cars to long wheelbase L3 vans.

What are the special features of the AV arms?

The design optimizes the arm by simplifying the fine adjustment of the adapter while maintaining maximum reach and retraction values.

The arms extend 20% further than standard arms, and the reduced, adjustable height of the adapter allows you to easily reach the required position, lift and repair battery-powered electric vehicles, luxury vehicles and monocoque vehicles.

The outer arm and adapter are at the same height, reducing the chance of the arm coming into contact with the vehicle's underbody.
